# The world around us is getting smarter

## Libelium Smart World

### Air Pollution

Control of CO<sub>2</sub> emissions of factories, pollution emitted by cars and toxic gases generated in farms.

### Forest Fire Detection

Monitoring of combustion gases and preemptive fire conditions to define alert zones.

### Wine Quality Enhancing

Monitoring soil moisture and trunk diameter in vineyards to control the amount of sugar in grapes and grapevine health.

### Offspring Care

Control of growing conditions of the offspring in animal farms to ensure its survival and health.

### Sportsmen Care

Vital signs monitoring in high performance centers and fields.

### Structural Health

Monitoring of vibrations and material conditions in buildings, bridges and historical monuments.

### Quality of Shipment Conditions

Monitoring of vibrations, strokes, container openings or cold chain maintenance for insurance purposes.

### Smartphones Detection

Detect iPhone and Android devices and in general any device which works with Wifi or Bluetooth interfaces.

### Perimeter Access Control

Access control to restricted areas and detection of people in non-authorized areas.

### Radiation Levels

Distributed measurement of radiation levels in nuclear power stations surroundings to generate leakage alerts.

### Electromagnetic Levels

Measurement of the energy radiated by cell stations and WiFi routers.

### Traffic Congestion

Monitoring of vehicles and pedestrian affluence to optimize driving and walking routes.

### Smart Roads

Warning messages and diversions according to climate conditions and unexpected events like accidents or traffic jams.

### Smart Lighting

Intelligent and weather adaptive lighting in street lights.

### Intelligent Shopping

Getting advices in the point of sale according to customer habits, preferences, presence of allergic components for them or expiring dates.

### Noise Urban Maps

Sound monitoring in bar areas and centric zones in real time.

### Water Leakages

Detection of liquid presence outside tanks and pressure variations along pipes.

### Vehicle Auto-diagnosis

Information collection from CanBus to send real time alarms to emergencies or provide advice to drivers.

### Item Location

Search of individual items in big surfaces like warehouses or harbours.

### Water Quality

Study of water suitability in rivers and the sea for fauna and eligibility for drinkable use.

### Waste Management

Detection of rubbish levels in containers to optimize the trash collection routes.

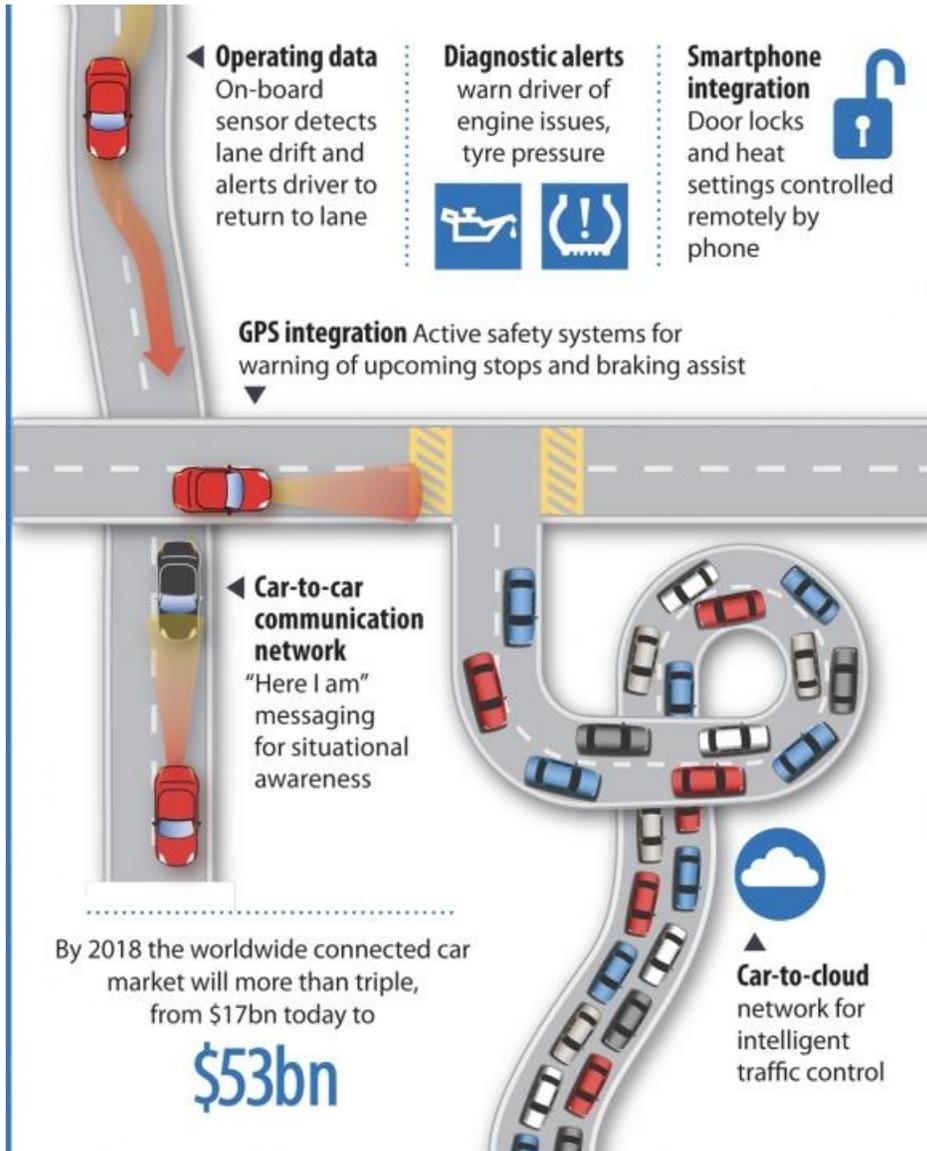

### Smart Parking

Monitoring of parking spaces availability in the city.

### Golf Courses

Selective irrigation in dry zones to reduce the water resources required in the green.

# Speed and Volume of Data is increasing

Volume and speeds at which data today is generated, processed and stored will fundamentally alter the transport sector.

- The combination of low-cost sensors, low cost storage devices and new data mining and machine learning algorithms will provide significantly more detailed representations of reality.
- Sensors, data storage and communication capacity in automated and connected vehicles will provide enhanced safety.

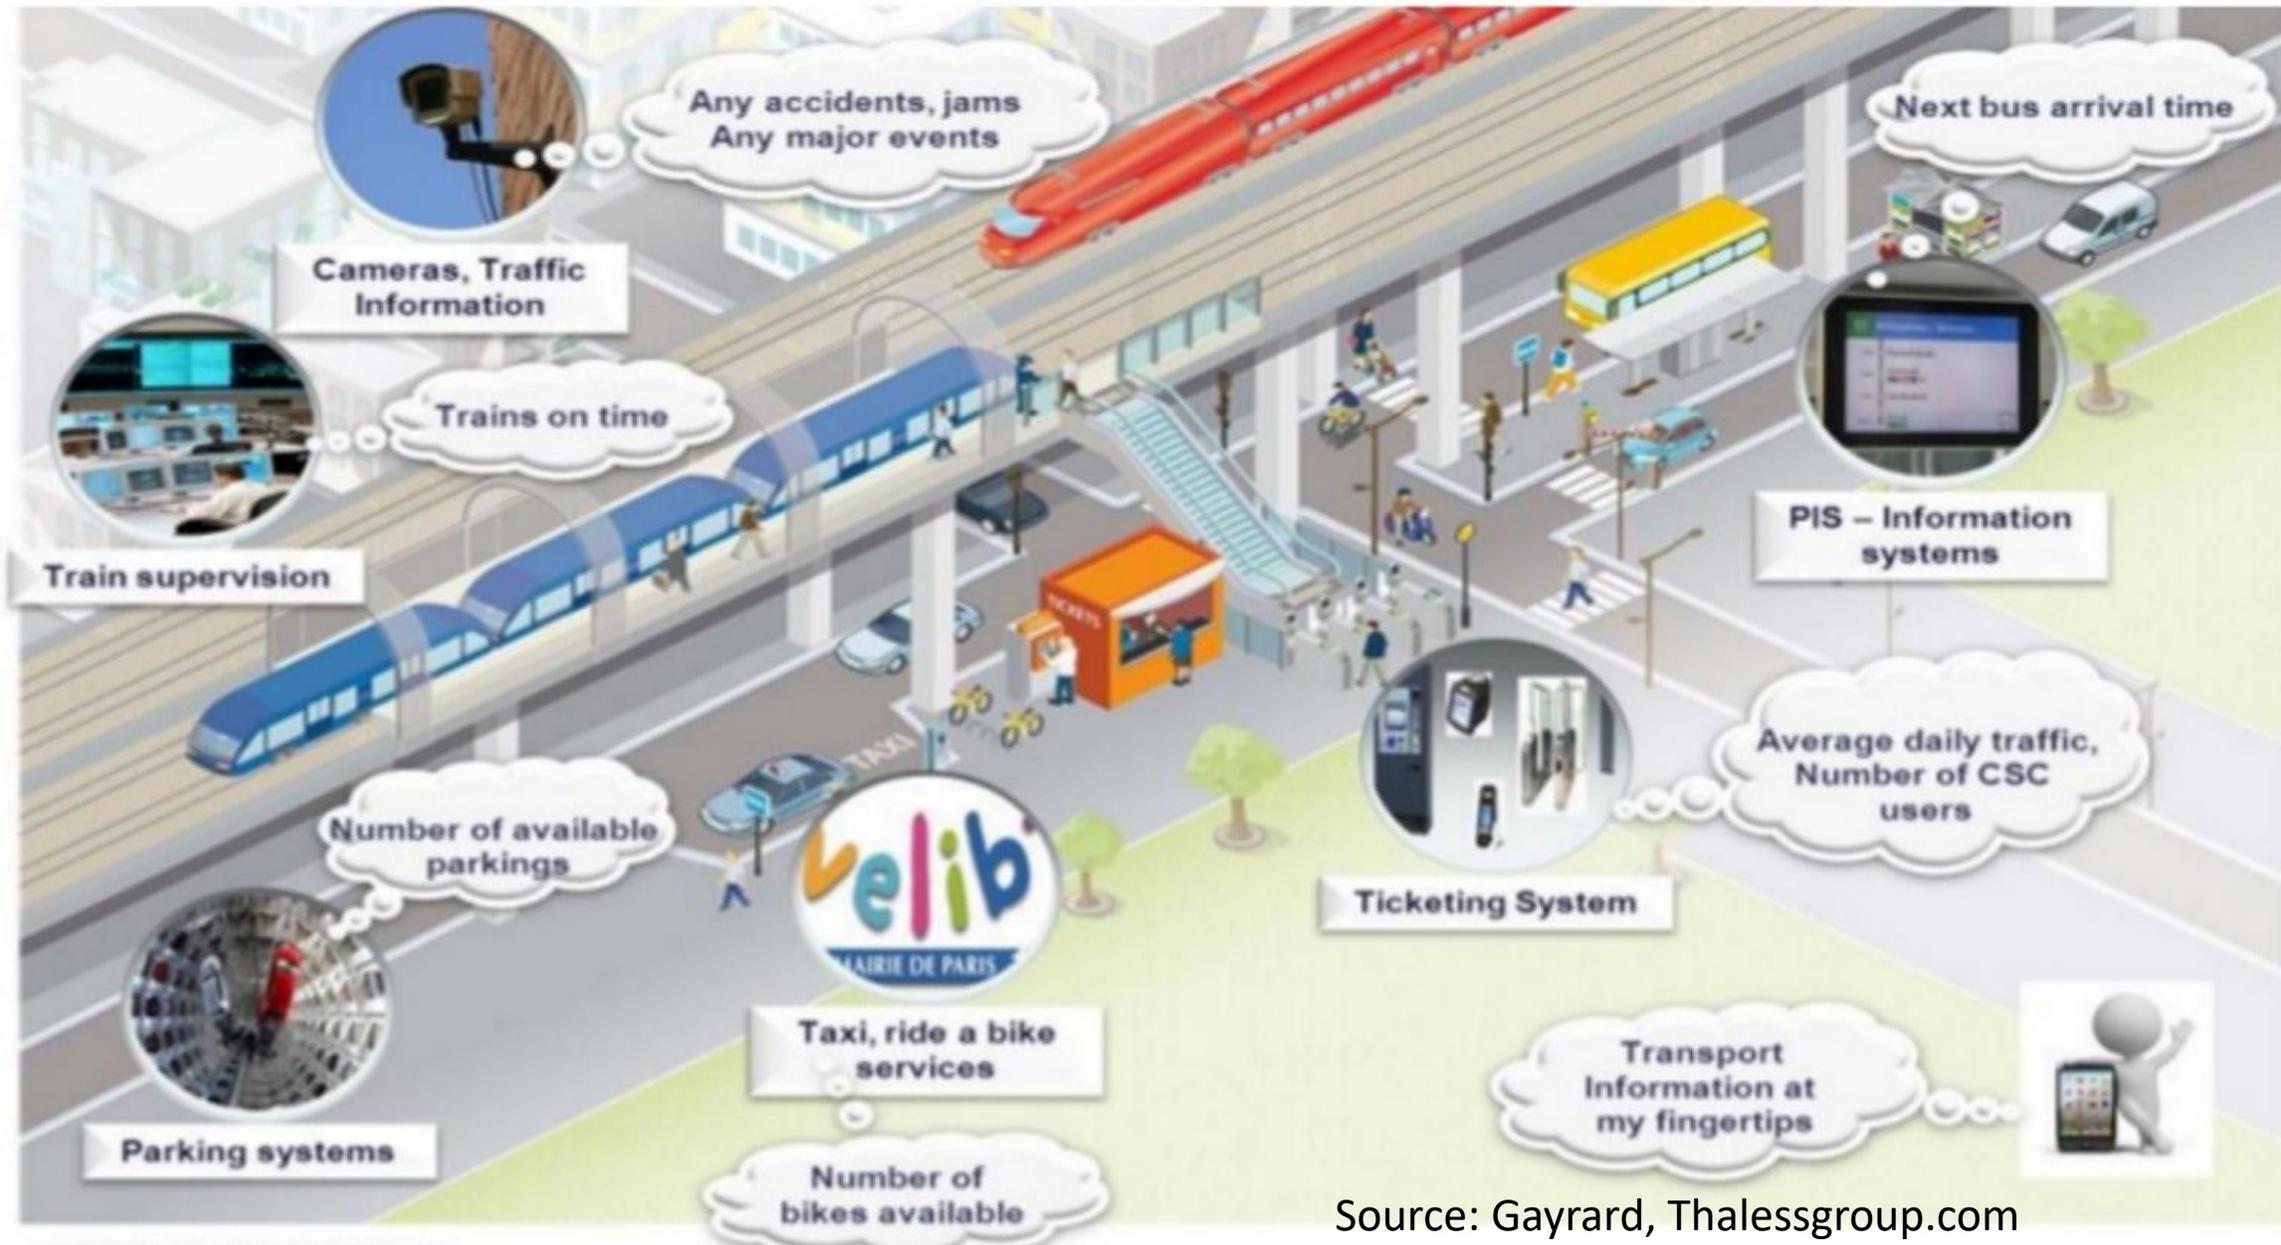

Accuracy of data will be significantly improved by Mobile sensing technologies

- Precisely locate and track people within precision of a few inches in both outdoor and indoor environments.
- Similar technologies can be built into vehicles, enabling precise and persistent tracking.

 Text Recognition from Images

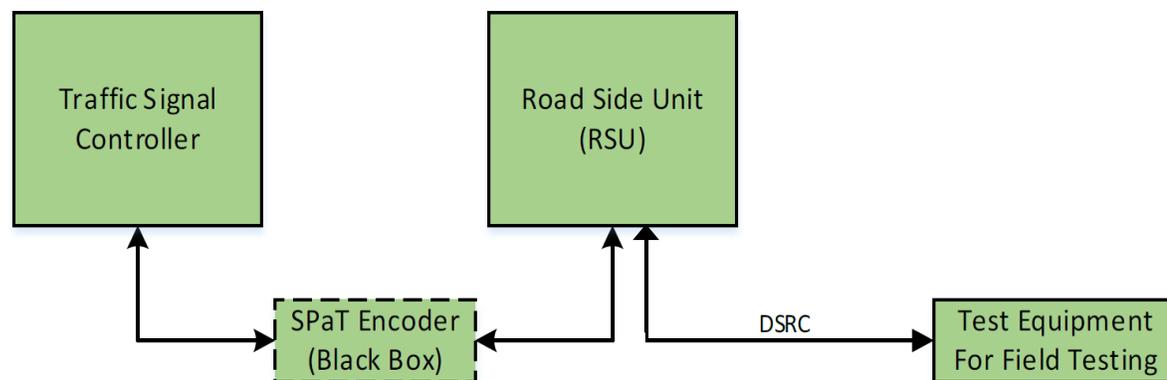

# SPaT Data Analytics

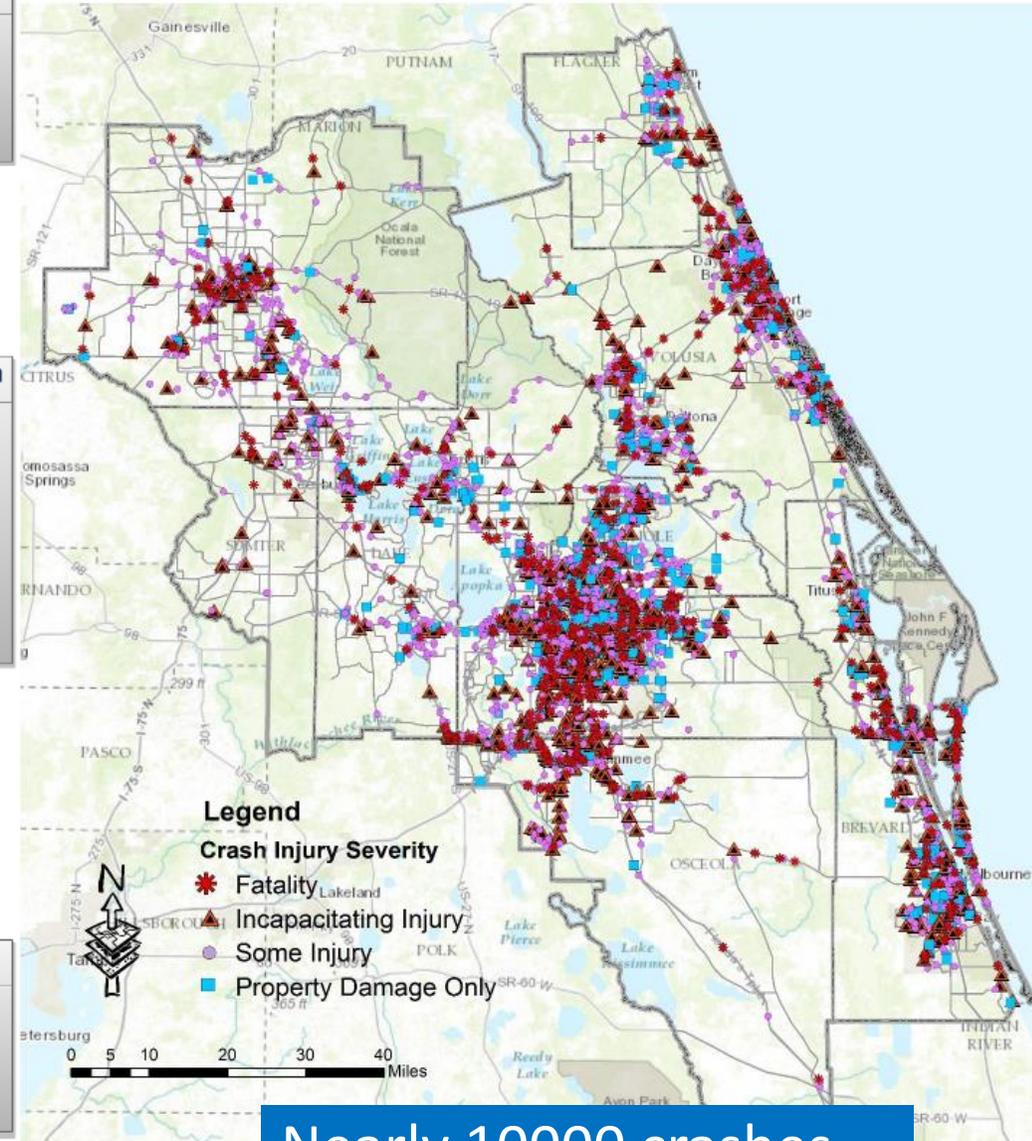

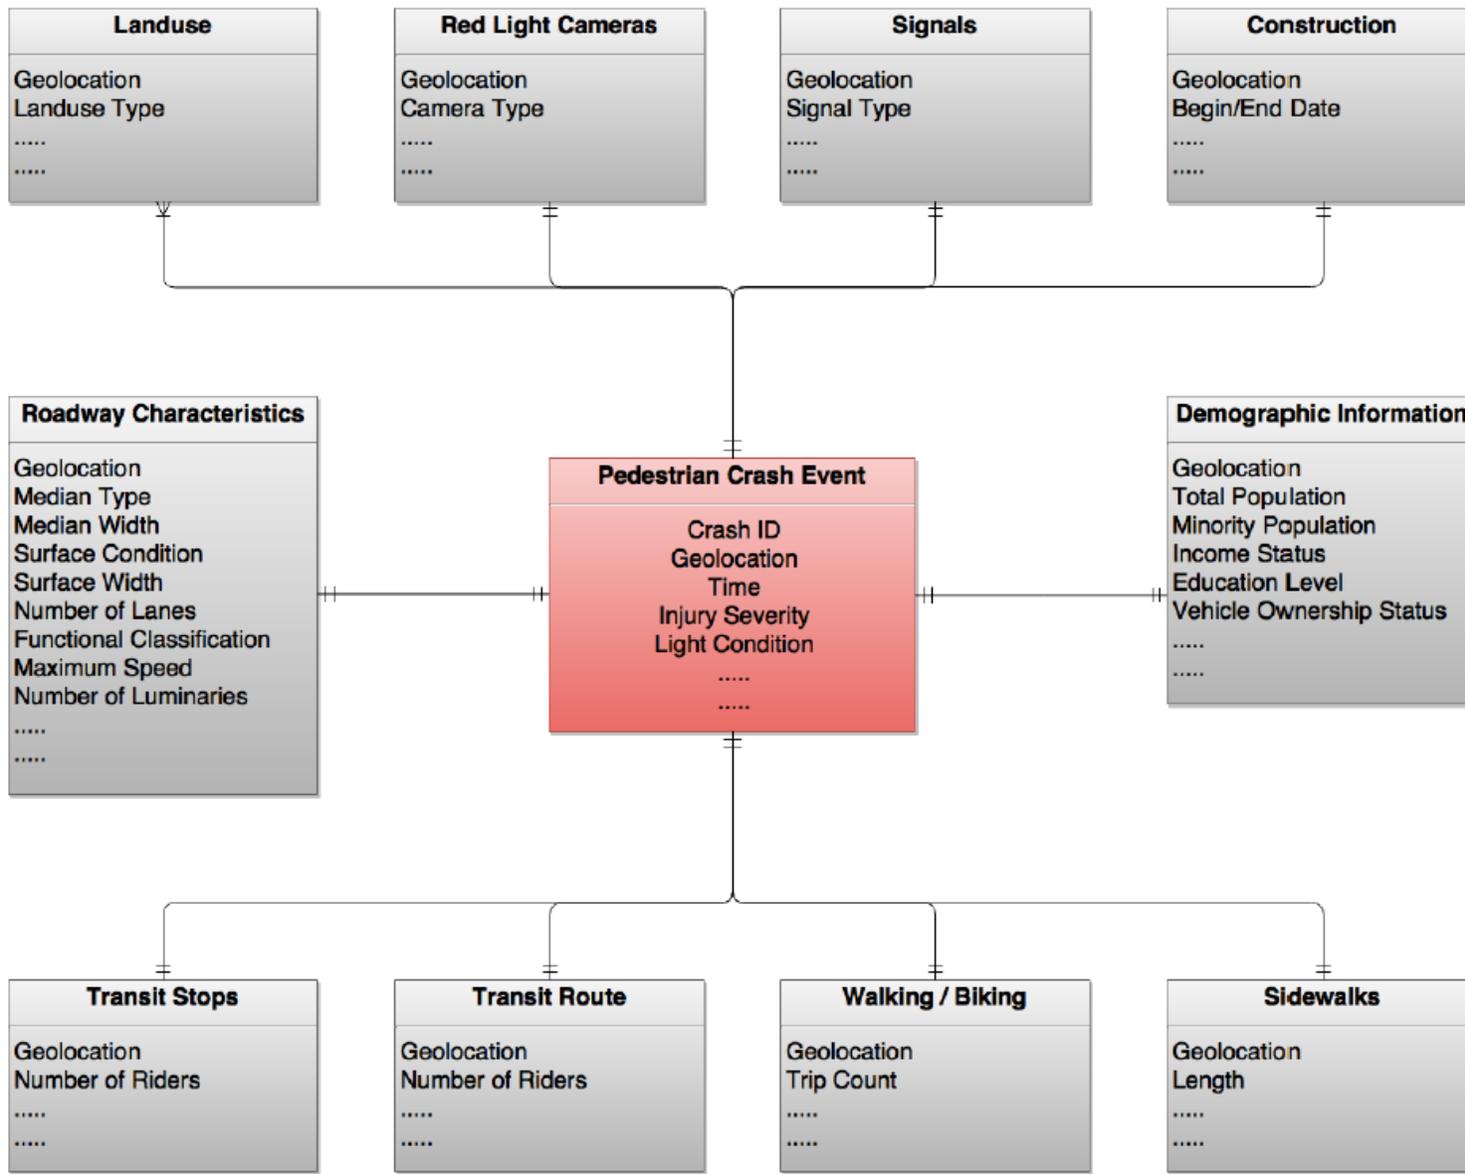

SPaT/MAP message based applications (Time-to-Change Notification, Red Light Violation Warning, etc.)

Warnings (Forward Collision Warning, Emergency Brake Light Warning, Do Not Pass Warning)

TIMs - Curve Speed Warning, Speed Limit Changes/Updates, Work Zone Warning, and others (the ability these depend on which corridor is chosen for the instrumentation)

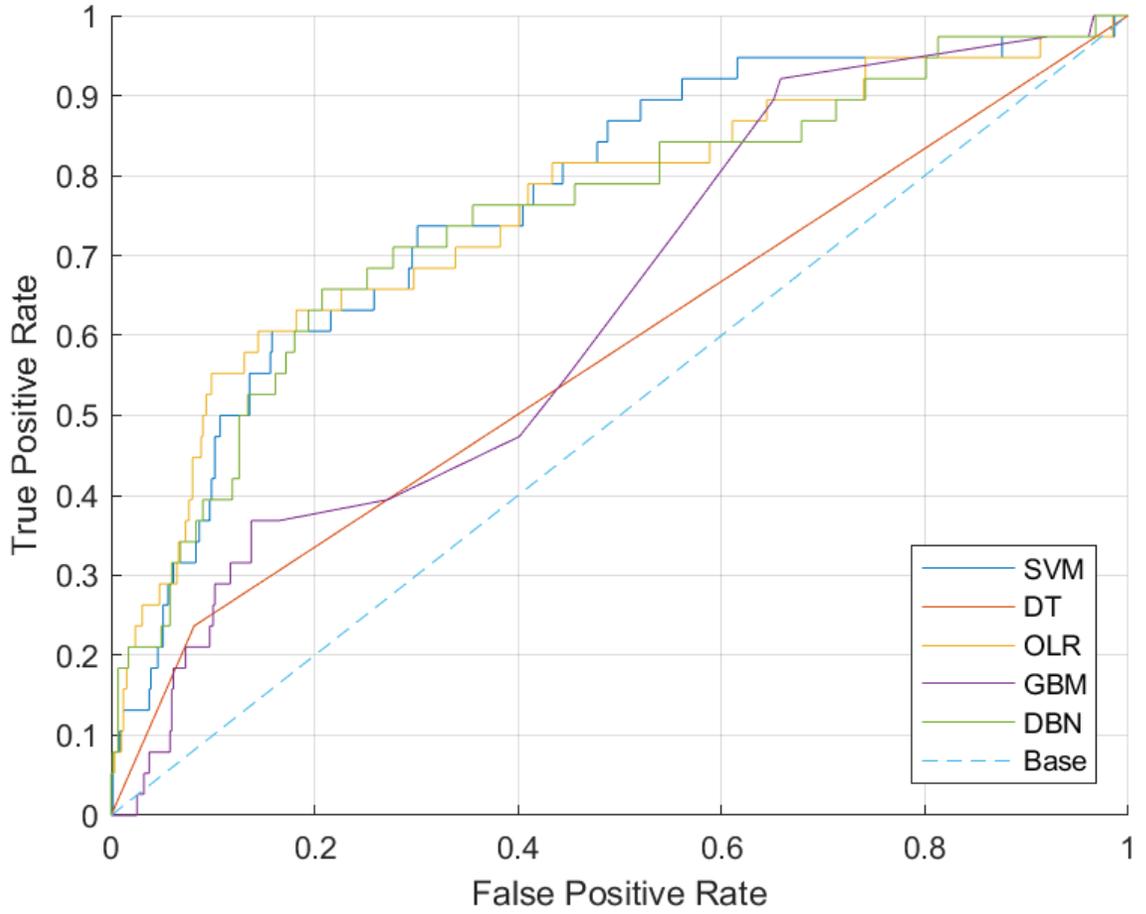

# Bigdata: Predicting and preventing fatal crashes (FDOT D5)

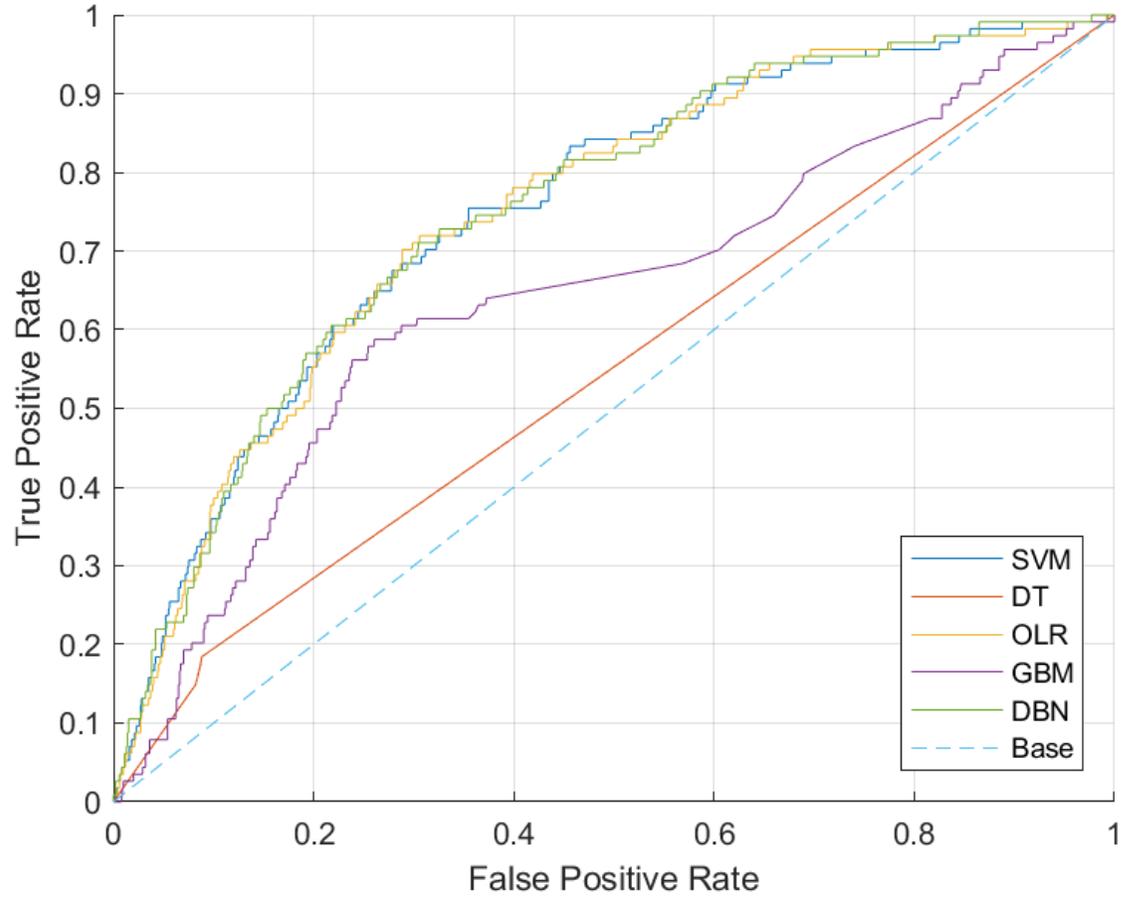

Nearly 10000 crashes

# Predicting ROC Curve

# Important Predictors

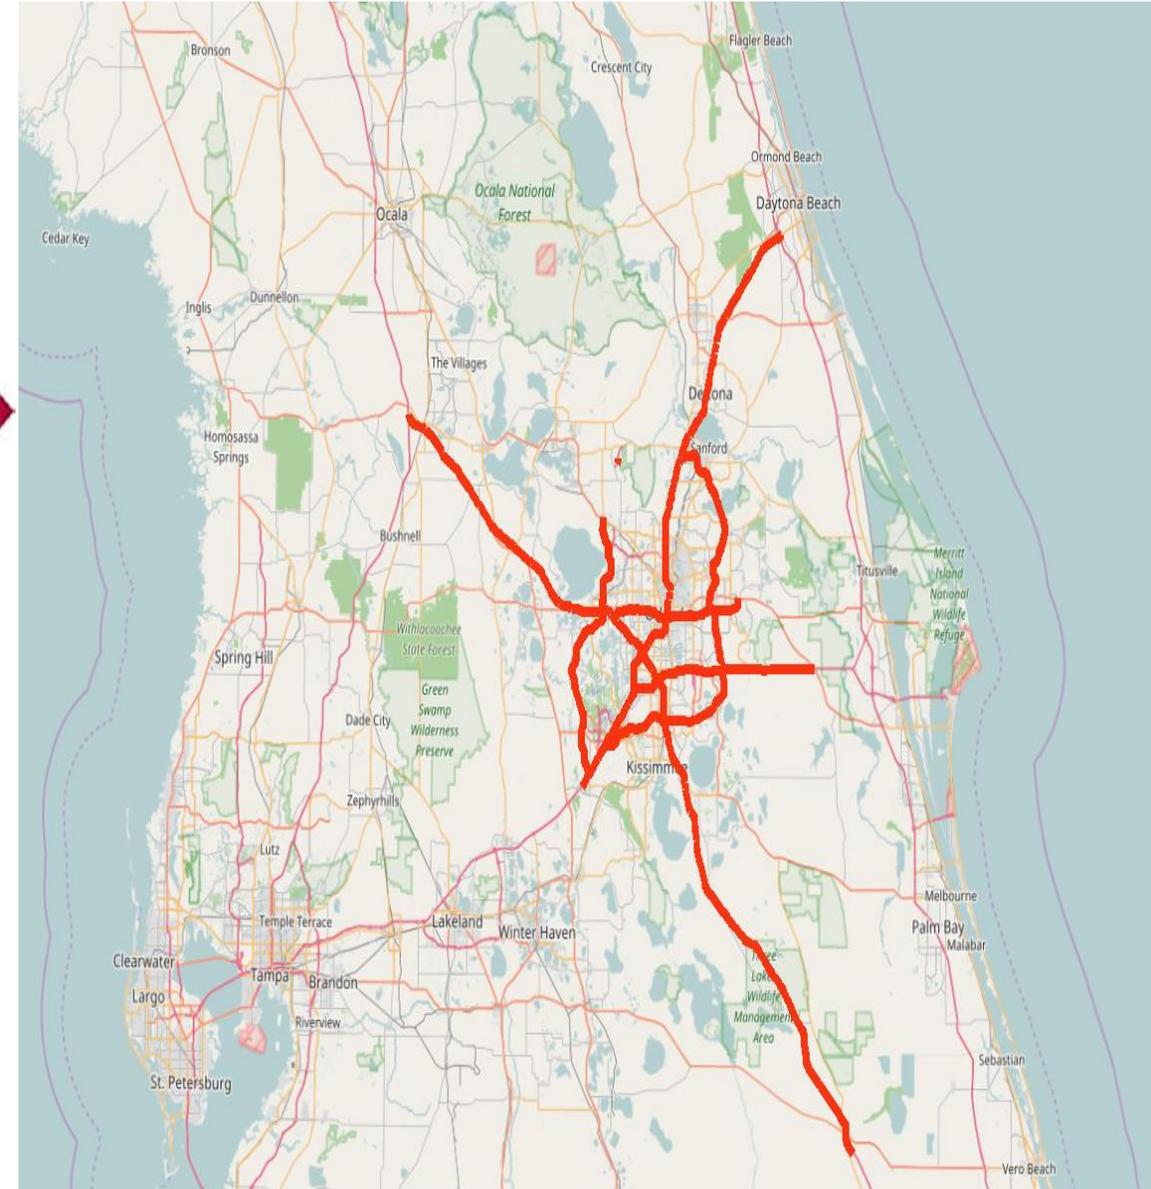

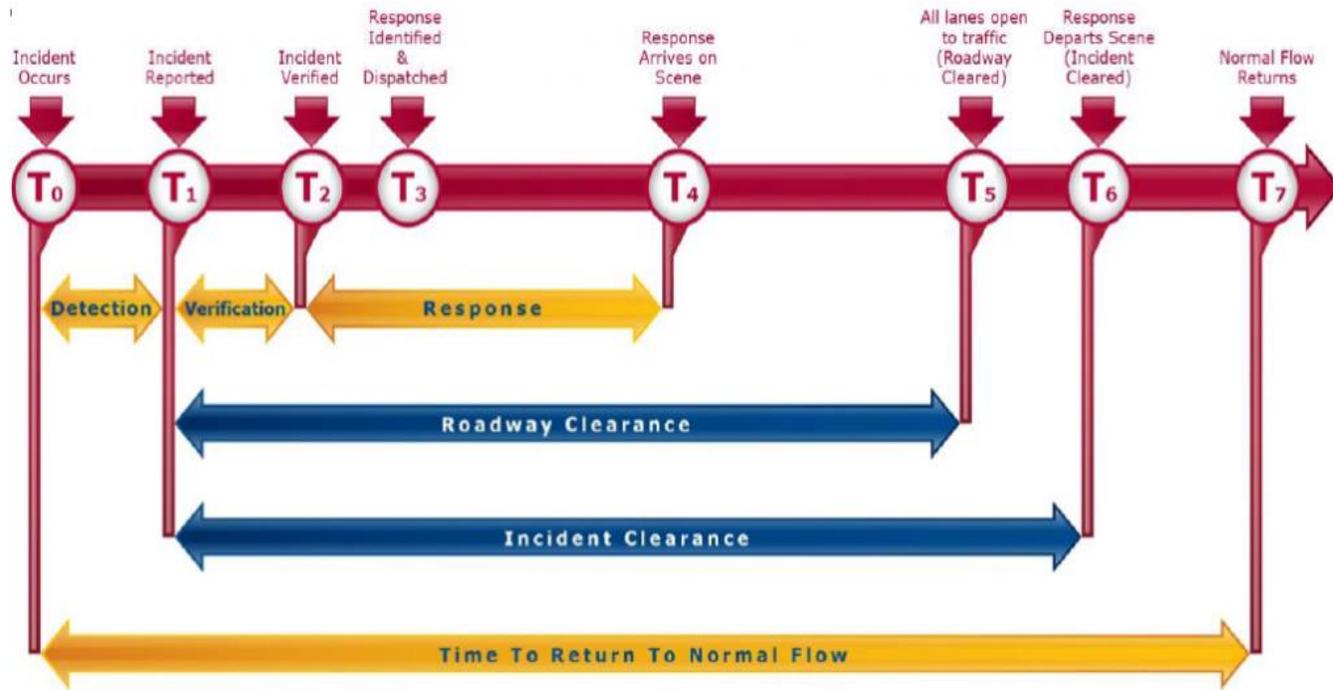

Predictor Description	Coefficient
Means of transportation to work, other means	0.745
Percent of persons, American Indian and Alaska Native alone	0.390
Means of transportation to work, bicycle	0.362
Percent educational attainment, 25 years and over Bachelor's degree only	0.173

Intersection

Predictor Description	Coefficient
Percent of persons, some other race alone	0.597
Means of transportation to work, walked	0.349
Partial sidewalk gap with sidewalk missing on one of the roadsides	0.266
Distance to the nearest transit stop	0.247
No sidewalk gap, with sidewalk missing on one roadside	0.209

Non-Intersection

# Road Ranger Analytics

# Average Incident Duration

# Problem Description

Objective: Optimize the average delay by advising automated vehicles and controlling signal phase and timing (in real-time)

## Sensing technologies

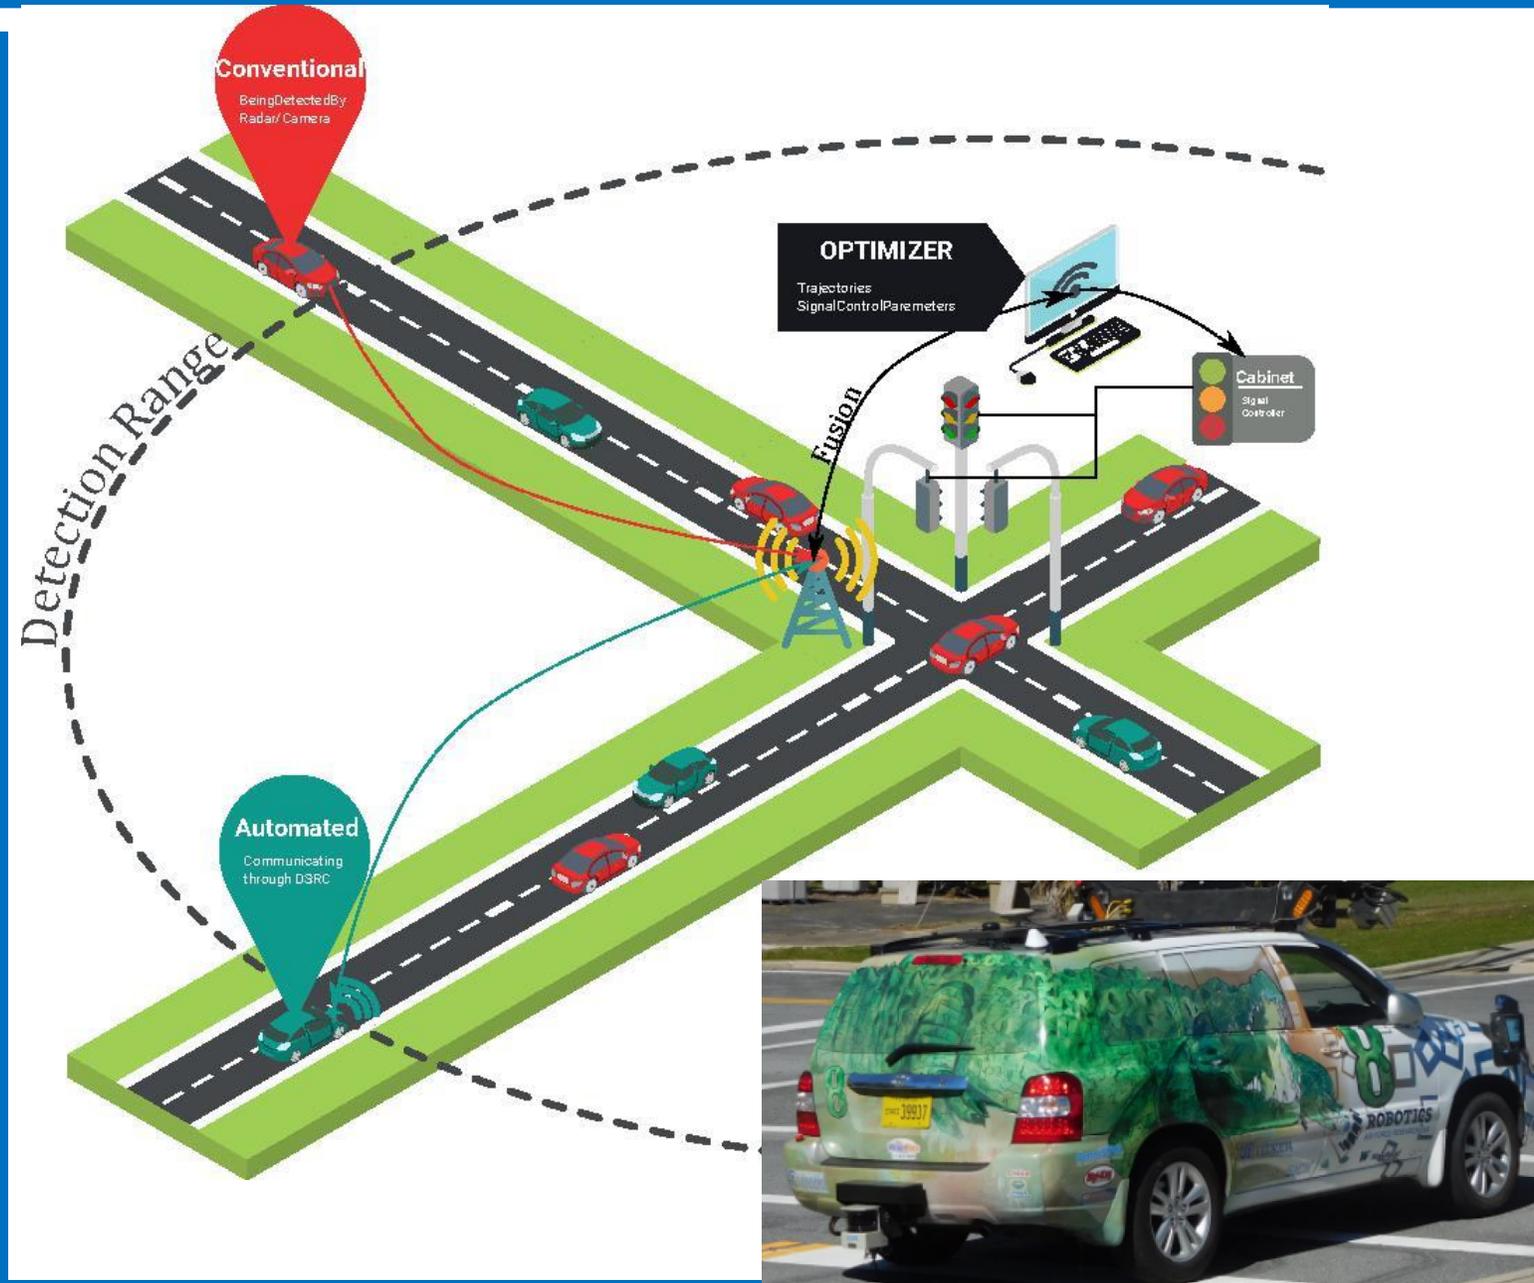

- Dedicated Short Range Communication
- Radar
- Camera, Lidar

## Autonomous Vehicle Technology

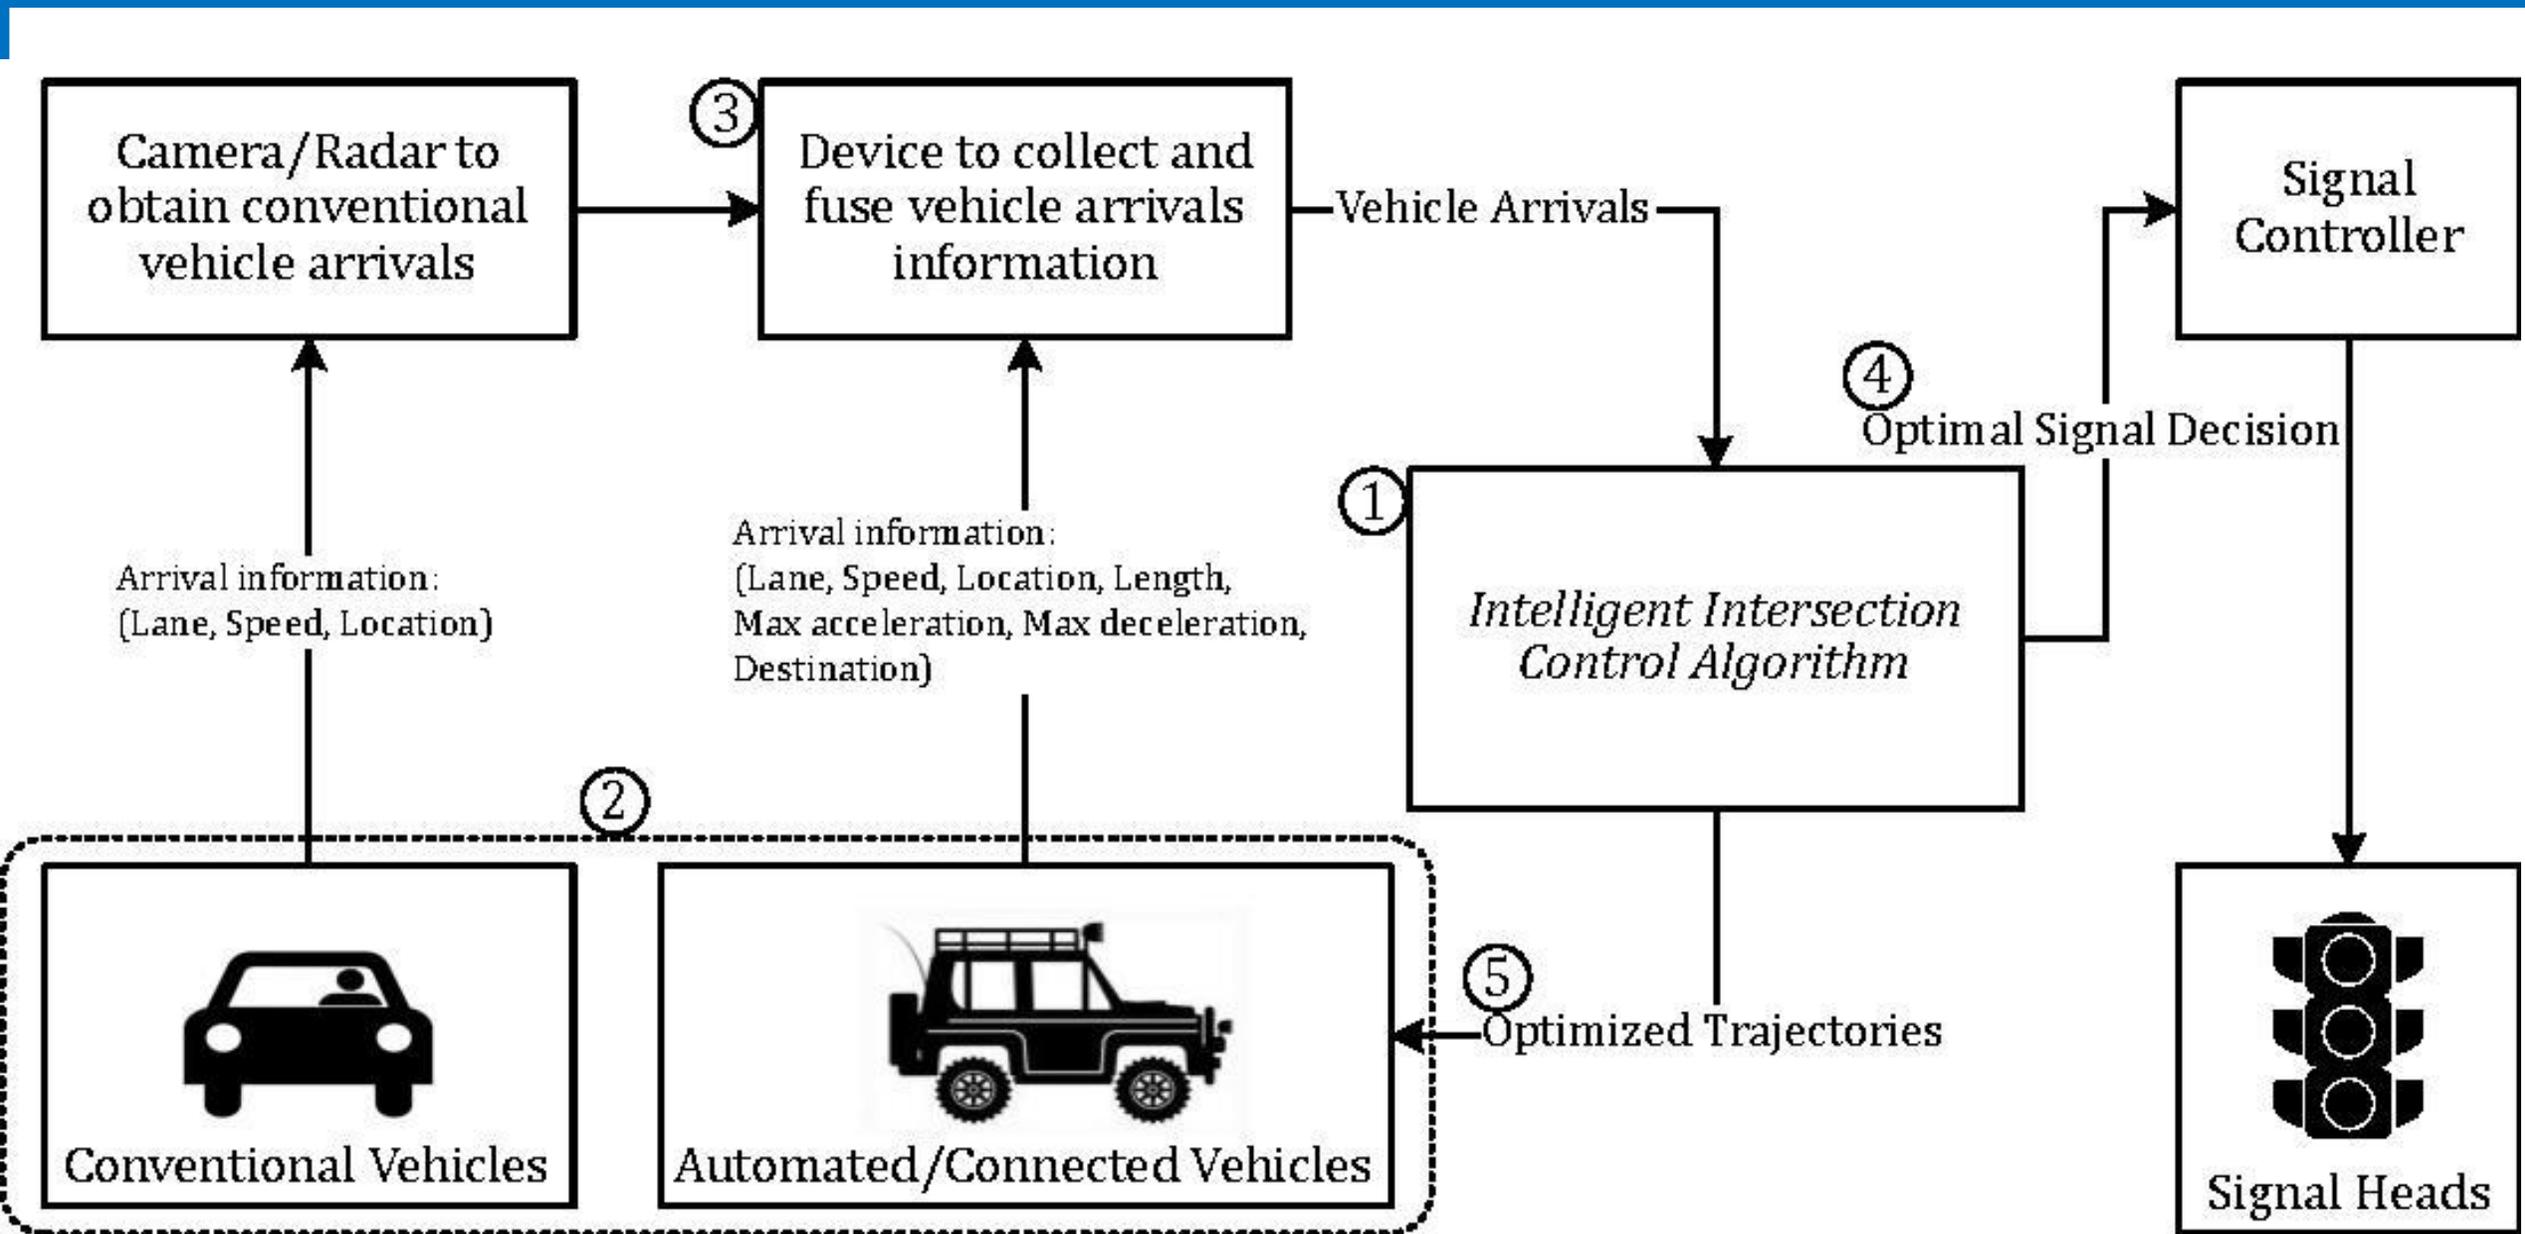

- Navigation and Localization algorithms

## Optimization Algorithm

- Vehicle Path Optimizer
- Signal Status Optimizer

# Intelligent Intersection Control System

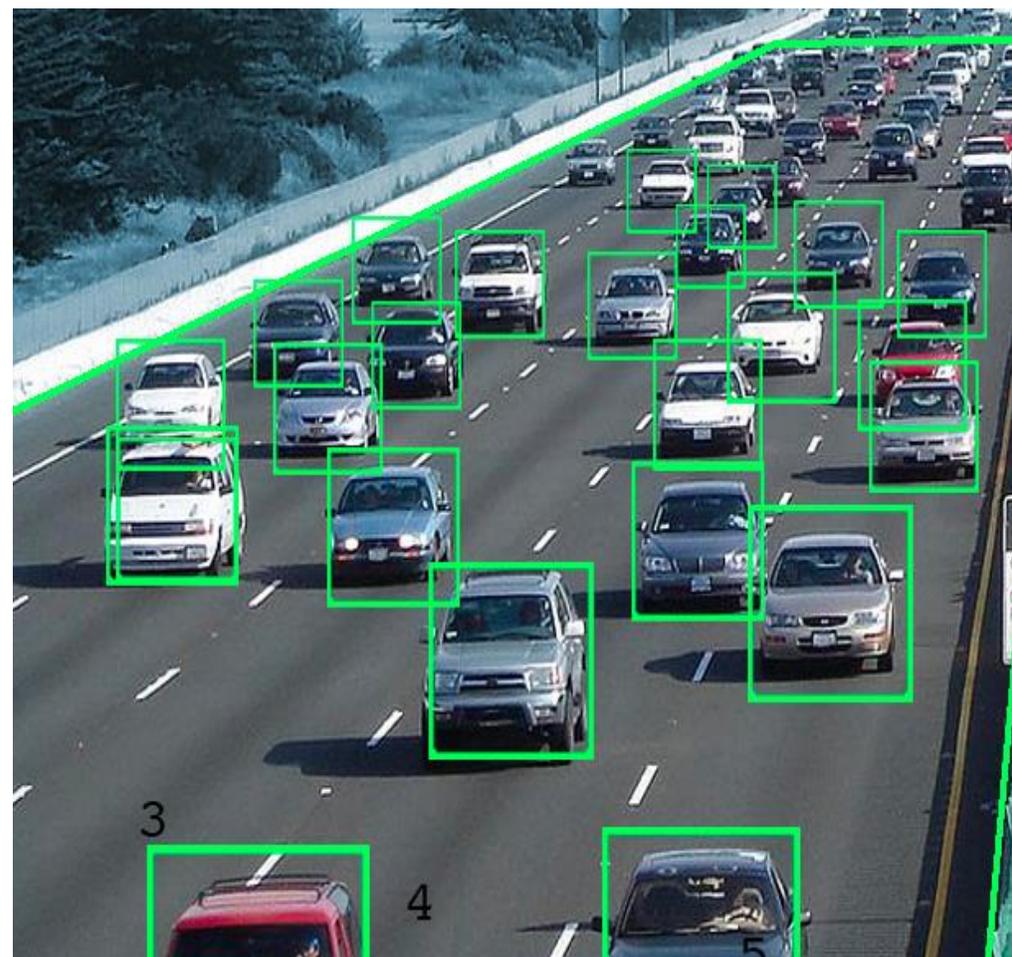

# Sensor Fusion for Intelligent Intersection Control

Goal: Classify and track all traffic participants up to ~600 feet away from the intersection

Challenging Multisensor-Multitarget problem

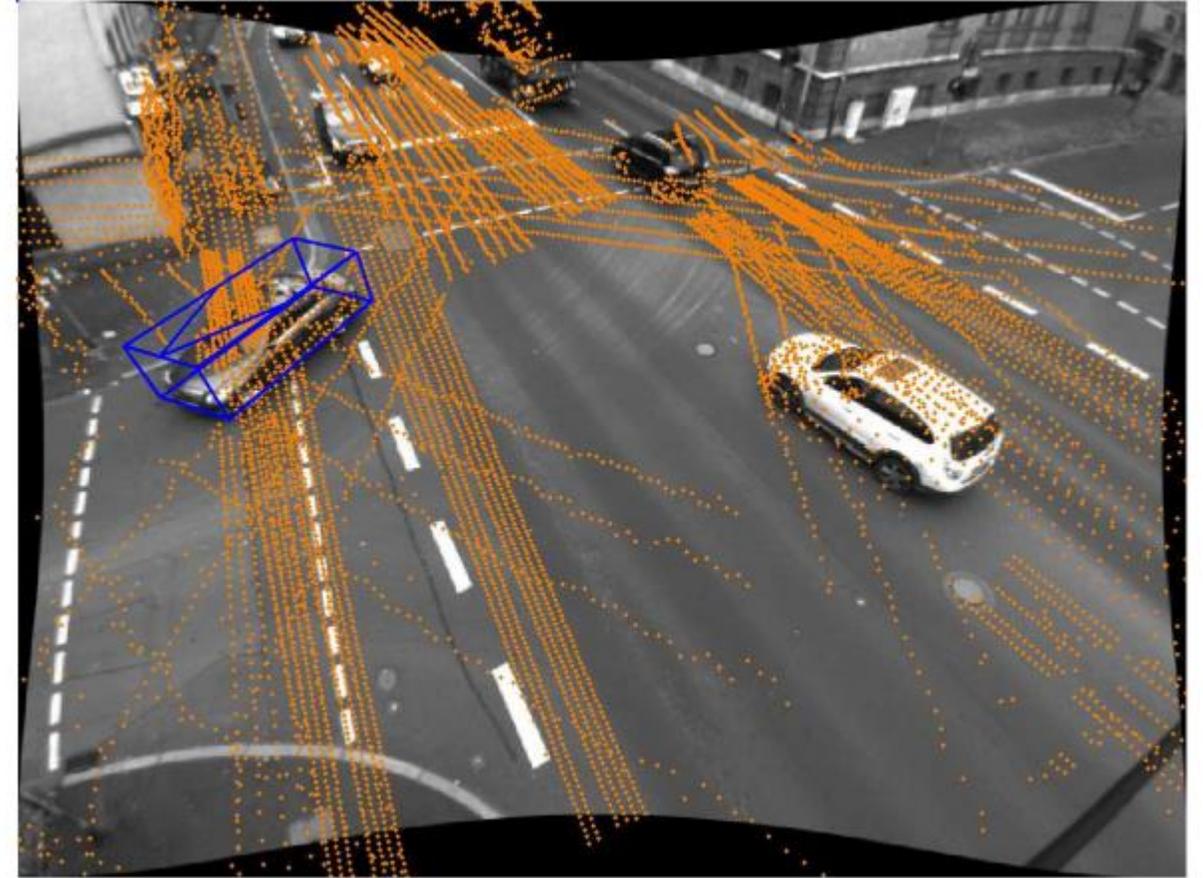

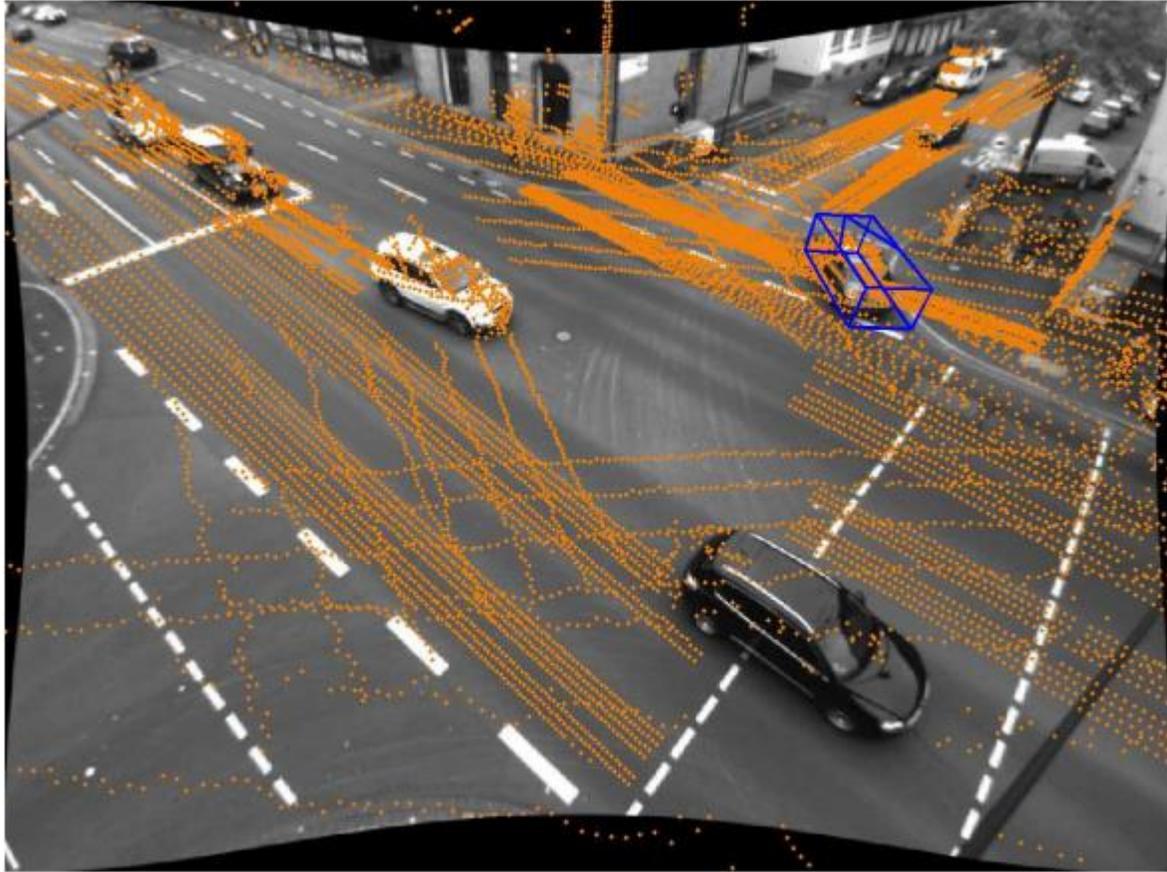

- Occlusion is common in medium-heavy traffic
- Need to synchronize and associate sensor data in real-time
- Need accurate models of uncertainty in sensor measurements and vehicle dynamics

# Sensor Fusion

# Assignment Problems in Multi-Target Tracking

Track-to-track Association (T2TA) and Data Association are core problems in multi-target tracking systems where sensor measurement and tracks are matched spatially and temporally

Instances of linear and multidimensional assignment problems

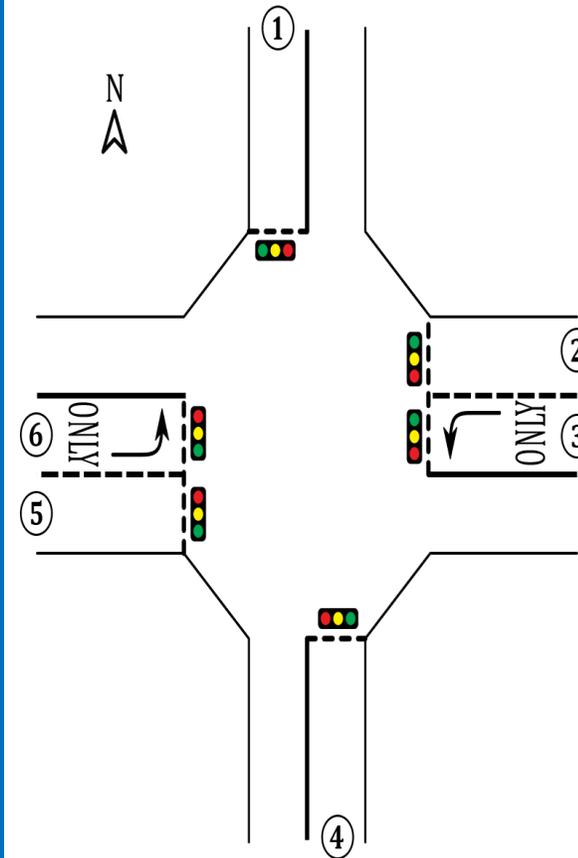

# Signal Optimization Algorithm

Objective: Minimize the Average Travel Time Delay experienced at the intersection

Approach: Mathematical Programming

Description:

- Automated Vehicles Shall receive a trajectory at the time they enter the detection range
- The Trajectories Shall comply with signal status and have no conflict with other vehicles
- The joint decision on Trajectories and Signal Phase and Timing yields the minimum average travel time delay

Phase	Movement
1 SB L,TH,R	
2 NB L,TH,R	
3 WB L/TH,R	
4 EB L/TH,R	

# Conclusions

- ❑ Transportation is going through a IOT revolution
  - New Sensors (Video, Lidar, Radar, ....)
  - New Types of Vehicles
  - New Communication Standards
  - Cheap Computing and Storage Resources
- ❑ Use of Data Analytics and Real-time Algorithms is becoming increasingly important
- ❑ Significant challenges for Computer Scientists to develop real-time and offline changes
- ❑ Need for multidisciplinary approaches for solving these problems

# Collaborators (University of Florida)
